Process Meter is a utility that monitors the resource consumption of your system's processes. Process Meter is a free application that can help you identify and control over resource usage by your system's processes. Provides graphical representations of various indicators related to running processes including CPU, memory, handles, threads, address space, and virtual memory requirements. The information is presented as a three-dimensional chart that can be easily read by anyone. It provides a convenient way to get your system's processes in order and identify the activities that take up the most system resources. You can view all this information by selecting indicators from various menus, including File, View, Edit, and Help. It can also be controlled by means of a wizard-driven interface. Control the resource usage of your system's processes. Process Meter can help you identify the most resource-hungry processes. Additionally, it can help you configure your system to achieve more effective use of system resources. In this respect, the application represents an efficient way to control resource usage by your local PC as well as remote workstations. You can set the following limits for monitored resource-consuming parameters: processor usage, memory usage, handle limit, threads limit, and virtual memory usage. The resource consumption indicators are updated as time goes by to provide a complete picture of the situation. Process Meter can display the following information for each process: • Processor time • Memory usage • Handle usage • Thread count • Address space • Virtual memory usage You can set the name for each process to provide an efficient overview of the processes in a graphical manner. Print your chart to send it to your printer with a few clicks. Save the chart to show it later by means of a button. Clicking the Start button starts the timer. ... Process Meter is an application that allows you to monitor various process-related information on your system. The application can be used to display CPU and memory usage, the number of open handles and threads, as well as details such as the address space used by each process or the virtual memory it requires. This information can be displayed either as a bar chart or a chart of stacked rectangles. Process Meter Features: Automatically displays the CPU, memory and handle usage for each running process. There is no need to use additional tools like... Read more Process Meter displays graphical representations of various indicators related to running processes, either on the local computer or on a remote machine. The data is shown as a three-dimensional bar chart that can be easily read by anyone. Monitor resource usage for all the running processes There are various parameters you can monitor using Process Meter. The application can reveal the CPU and the memory usage, as well as details regarding handles and running threads for each process, the address space of each process and the virtual memory it requires. You can switch between parameters either from the right-click menu or from the View menu. Indicators are shown one by one and not at once, as the chart within the main window is updated according to your selection. Optionally, you can configure Process Meter to show a name label for each process, but this might overcrowd the chart when there is a large number of processes running on the host PC. Set limits for monitored parameters to ensure efficient resource usage Although its main purpose is to provide information about the system's processes and the resource consumption, Process Meter is not just an information extraction tool. In fact, the application enables you to manage resource usage by setting limits for each of the monitored parameters, whether we are talking about processor and memory usage, or the number of threads a process can open. Get resource usage information on local or remote systems Process Meter is not a spectacular or innovative application, but it does its job well, displaying relevant data regarding resource usage. The chart itself can be printed on paper or saved as an image for later reference. Overall, it can become a handy utility in the toolbox of any network administrator who needs to keep a close eye on resource usage, both on the local PC and on remote workstations. Process Meter Description: Process Meter is an application that allows you to monitor various process-related information on your system. The application can be used to display CPU and b7e8fdf5c8

Process Meter is a software program that monitors and displays graphical representations of various indicators related to running processes. There are various parameters you can monitor using Process Meter, including CPU usage, memory usage, address space used, handles and threads, and virtual memory utilization. You can switch between parameters either from the right-click menu or from the View menu. The chart within the main window is updated according to your selection. You can configure Process Meter to show a name label for each process, but this might overcrowd the chart when there is a large number of processes running on the host PC. When you first open Process Meter, the application displays basic information for the selected process. You can view CPU usage, memory usage, threads used, handles, and memory allocated to the process. You can select the processes you want to view, or you can search for a process using different parameters. Process Meter supports several functions for saving charts and exporting them to a printer or to an image file. When you save a chart, you can specify the size of the image. Visually illustrate over 10 useful features of Process Meter. From the main window, you can switch between CPU, memory and handle charts. These charts show the highest priorities processes that are consuming CPU, memory and handles. Process Meter's main functions: 1) Monitor and graph various details regarding running processes such as CPU usage, memory usage, handles and threads, memory allocated to a process, address space used, and virtual memory utilization. 2) Display process parameters such as Name, CPU usage, memory usage, handles, threads, virtual memory utilization, memory allocated to a process, address space used, and maximum time the process was active. 3) Display CPU, memory, handle, and thread charts for all active processes 4) Examine charts for selected processes. 5) Set limits for monitored parameters to ensure efficient resource usage. 6) Measure various system parameters, including CPU, memory and handle consumption and the number of running processes, in order to check the system's stability. 7) View CPU, memory, handle and thread charts for all running processes, as well as several other useful information, such as the name and address of the process, the number of handles opened and active threads. 8) Print charts with higher resolution or save them to a printer or image file. 9) Display and graph the CPU, memory and handle charts for all running processes. 10) Start, stop, resume, and close selected processes. 1.
